

Project Information			
1. Student Name	Maximilian Meier		Student ID 3726174
2. Student Name	Simon Naß		Student ID 3460883
3. Student Name	Yonatan Mamo		Student ID 3702473
4. Student Name			Student ID
Group ID	02		
Project Title	HOME: Hotel Optimization and Managing Ecosystem		
Domain	<input checked="" type="radio"/> Smart building <input type="radio"/> Autonomous vehicle		
Type	<i>Specify the type of the non-residential building (e.g., warehouse, offices) or the type of the autonomous ground vehicle (e.g., delivery van, taxi).</i> Hotel		
Project Description	Monitoring	<i>Specify what monitoring aspects your system includes.</i>	
		temperature, light, room occupancy, room noise level etc.	
	Automation	<i>Specify what automation aspects your system includes.</i>	
		AC (heating/cooling), blinds, lights, window / ventilation, audio adjustment.	
	Objective	Assist guests by adapting to their activities. Plan efficient cleaning route.	
<i>Give a link to code repository (e.g., GitHub, Bitbucket, etc.). See slide 56 in slides set "01 Overview and logistics".</i>			
Code Repository Link	https://github.com/SimonNass/SCIoT_G02_2025.git		

System Design		
System components	Components	Functionality
	<input checked="" type="checkbox"/> IoT	Collection of data and execution of planned actions
	<input checked="" type="checkbox"/> Context	AI planing finds activities of guests
	<input checked="" type="checkbox"/> Problem generation	PDDL problem with newest IoT state
	<input checked="" type="checkbox"/> Planning	plan actuator changes and cleaning order
	<input checked="" type="checkbox"/> Execution	mapping actions to actuator change requests
	<input checked="" type="checkbox"/> Broker	communication between gateway and backend
	<input checked="" type="checkbox"/> Knowledge base	saving curent IoT and system state
	<input type="checkbox"/> Other. <i>Specify what other logical components your system has.</i>	

System Architecture Diagram

Include a clear diagram of your system architecture Ensure the diagram is a logical design and is not dependent on deployment and/or implementation.

System Distribution	
Number of Machines and Components Distribution	<input checked="" type="checkbox"/> 2+ machines
	Specify the type of each machine (e.g., PC, cloud, or Raspberry Pi).
	<div>Type</div> <div>PC (acting as server), Raspberry Pi (acting as gateway for IoT devices)</div>
	Specify what logical components are deployed on each machine.
	<div>Components</div> <div>PC: server, broker, frontend, AI planing Raspberry Pi: gateway, sensors, actuators</div>

IoT						
Sensors	Sensor (e.g., temperature)	Physical	Software-based	Human-based	Simulated	Virtual
	RFID	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
	temperature, humidit	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
	light sensor	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
	sound	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
	Other. Specify the remaining sensors and their types (if more than 4 sensors)					
	motion sensor, pressure sensor	physical, simulated				
Actuators	Actuator	Physical	Software-based	Human-based	Simulated	Virtual
	light	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
	motor	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
	air conditioning AC	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>
	heating	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>
	Other. Specify the remaining actuators and their types (if more than 4 actuators)					

System Integration	
Mechanism	<input checked="" type="checkbox"/> Publish-subscribe <input type="checkbox"/> Message queue <input checked="" type="checkbox"/> One-to-one
Messaging Middleware	<div> <input type="checkbox"/> JMS <input type="checkbox"/> ZeroMQ <input type="checkbox"/> Apache Kafka <input type="checkbox"/> RabbitMQ <input type="checkbox"/> Redis <input type="checkbox"/> IBM WebSphereMQ <input type="checkbox"/> Apache Qpid <input checked="" type="checkbox"/> Other: <div>Mosquitto</div> </div> <div> <input checked="" type="checkbox"/> MQTT <input type="checkbox"/> DSS <input type="checkbox"/> XMPP <input type="checkbox"/> AMQP <input checked="" type="checkbox"/> Other: <div>REST APIs</div> </div>
Mechanism	<p><i>Explain briefly which components of your system use indirect communication.</i></p> <p>The gateway and backend use indirect communication to exchange sensor and actuator data.</p>

Visualisation	
What is displayed	<input checked="" type="checkbox"/> Latest plan generated <input checked="" type="checkbox"/> Current state. <i>Briefly specify what exactly:</i> <div>List of latest IoT values and room occupancy and other metadata</div> <input type="checkbox"/> User control. <i>Briefly explain:</i> <div></div> <input type="checkbox"/> Other. <i>Briefly explain:</i> <div></div>

AI Planning	
AI Planning Technique	<input checked="" type="radio"/> Classical planning <input type="radio"/> HTN planning <input type="radio"/> Other: <div></div>
AI Planner	<p><i>Specify the name and link to the AI planner used in your project:</i></p> <div>https://github.com/AI-Planning/planning-as-a-service (dual-bfws-ffparser)</div> <p><i>Explain briefly why the chosen AI planner is appropriate for your project:</i></p> <div>It was possible to make it run locally within our docker enviornment.</div> <p><i>Explain briefly the main components of your domain model:</i></p> <div> <ul style="list-style-type: none"> - potential actuator influences on sensor actions - actions to detect and check fulfillment of activities - save energy actions - cleaning team room topology movement algorithm </div> <p><i>Explain briefly what constitutes an initial state in your problem instances:</i></p> <div> Initial State room topology, occupied rooms, IoT state, actuator to IoT map </div> <p><i>Explain briefly what constitutes a goal in your problem instances:</i></p> <div> Goal clean with min movement, rooms save energy or fulfill activity </div>
Problem Instance	<div> Problem instances are generated <div> <input type="radio"/> Once, before system starts. <input type="radio"/> Whenever a state change happens. <input checked="" type="radio"/> Other. <i>Explain briefly:</i> <div>after timeout or if frontend requests a new plan</div> </div> </div>
